Car Modification Planner

Problem Statement

As someone who enjoys researching vehicle upgrades, I've found that modification information is often scattered across multiple websites and forums...

Project Idea

A Python application that helps users plan vehicle modifications...

Eisenhower Matrix

Do (MVP)

- Allow users to select a vehicle model
- Allow users to enter a modification budget
- Recommend modifications based on vehicle, budget, and performance goal

Schedule (V2.0+)

- Estimate horsepower gains
- Save and load build plans
- Add support for additional vehicle platforms

Delegate

- JSON file handling
- Table formatting
- Data validation utilities

Delete

- AI-generated recommendations
- Real-time retailer pricing
- User accounts and cloud storage

Tech Stack

Language: Python 3

Libraries: json, os, tabulate (optional)

Data Storage: JSON files

Data Sources: Local JSON database

Development Tools: VS Code, GitHub

Milestones

1. Set up repository and project structure
2. Create vehicle and modification JSON files
3. Build user input system
4. Load and process vehicle data
5. Build recommendation engine
6. Calculate costs and remaining budget
7. Create CLI output
8. Add validation and error handling
9. Test and debug
10. Finalize documentation
